Amphora Project: KT₅

Kocher, Corinthian Amphorae

N.B. This printout is now out of date, in many

cases the computer no longer has what is given

here. No further markings should be made on

this printout; changes or comments should be

written on a separate sheet & given to PHOT

of me so that they get into the computer.

200 jars altogether of the three Corinthian types. The amphora classes in some periods a size of several hundred recovered, but sizes have not been recovered for the period A and A⁺ jars are on the whole much larger than those of other Greek amphora series; in all periods they are the amounts, the smallest about 18 liters, the largest 30, and the majority above 20. Type A⁺ jars range in size from 15 to 25 liters. With Corinthian B amphorae, however, there have been more variations. The range for the period A⁺ has been smaller size, but for the early and middle Corinthian periods seem to have achieved a certain intended size. Ten jars at least from the deposit in the Via Politeo (see above) which were measured with water held a mean of 25.0 +/- one standard deviation of 0.995 liters. Further measurements of archaeological groups of intact Corinthian A⁺ and B amphorae, when these are available, will determine whether there were "normal" sizes for Type A and A⁺ jars as well, and for Type B jars in other periods.

Corinthian amphorae furnish important evidence for the economic and trade not only of Corinth but of the wider Greek world as well. I.B. Bratschkii and I.B. Iest have shown that they formed at least some part of exports to the Black Sea and other areas to the northeast of the Greek mainland. It has not been identified hitherto in any great quantity in these regions, but it is noted that this country will be bringing about an assessment of the role in which it played.
