numbers on their handles, now put away, faute de mieux (the museum being very poor), in baskets by fifties. The original is my numerical list or inventory. Photographs were taken except in the case of very bad examples or much repeated types. The photography worked well: the museum provided a 500-watt lamp, and the local Kodak people gave me a special rate, so that I got pictures at a total cost of about 2 cents apiece. These are all taken at a scale of 1:3.6 (Leica no.3 front lens, focus set at one meter), which takes in the whole handle yet permits enlargement to actual size without too much strain. The unenlarged photographs, in which the inscriptions are in most cases easily legible, are pasted on the heavy paper carbon copy of the readings before it is divided into cards and sorted. Photograph references appear with the readings, and a record is kept elsewhere of the series of stamps in each roll. In the face of cubic meters of material, some simple and logical system had to be devised to allow the

all these

Two Chandelis

probably from the same
jar, according to
fabric, firing,
forming, binding-
place.

Drawer Ie - 3d cent. B.C.

Hikesios group: thick handles (approaching the round in section) with little or no arch, of fine red clay variously fired (often in rings of color on the section); apparently from a type of jar with angular shoulder and rim rising high above the upper handle attachment, of which jars P 1114 (from HAT Group B) and P 3402 (from HAT Group E) are shown in the photographs tacked in the drawer. A late 4th B.C. example is P 11,295; and a late 1st B.C. example, P 9670, appears in a photograph tacked in Drawer IId. The stamps Hegesiou, Hikesiou, and Philisteus, here represented by 7996, 886, and 2194, appear in the early Hellenistic fill and in others which seem to be 3d cent. Compare 140 in the previous section. A handle of Hegesios occurred in the Pnyx FAP III (see p. 1) but this seems to be a stray. (A few handles clearly later than 350 B.C. do appear in this fill.)
Thick handles curving down quickly, with gem impressions, etc. The thickness is chiefly down the middle. Note the rim like a fat early Knidian rim on 4711. Red clay, unevenly fired (cf Hikesios group).

The letter P before the figure for the height indicates that the full height of the jar is not preserved.

Capacity means capacity to the brim. SS jars have been repaired with plaster, so had to be measured by dry measure (wheat). The Athens National Museum items were also measured with wheat, water being inconvenient. The rest were all measured with water. Where part of the neck was missing, note was taken of the interior diameter of the neck and of the height from the bottom of the break to the brim, and the volume of the cylinder of these dimensions has been added to the volume measured by the water, resulting in figures which sound like impractically fine-drawn measurements.

* The Paphos capacity measurements all seem too little.
 even Cy 278 according to other measurements should be approximately
 more capacities than Cy 273
